PREFACE

The Yearbook of Agricultural Statistics is an annual publication of Bangladesh Bureau of Statistics (BBS). This publication attempts to portray a wide spectrum of Agricultural data and information in a comprehensive and systematic manner. This Publication contains Agricultural Statistics on estimates of crop production, crop damage, meteorological information, agricultural inputs (seed, fertilizer, monthly agricultural wage, irrigation), land use, results of Agriculture Census, livestock, forestry, fisheries, crop prices, exports and imports of agricultural products & inputs etc.

The Publication provides annual estimates of area and production of 146 crops (major and minor) among which 6 are major crops (Aus, Aman, Boro, Wheat, Potato and Jute). Both objective (collection of data from direct observation) and subjective (collection of data through farmers' interview) methods are used for crop estimation. For considering the major crops estimation these methods are used as process of cross-checking.

My sincere thanks and gratitude to Ms. Aleya Akter, Secretary, Statistics and Informatics Division (SID). I also would like to thank Editors' Forum of BBS and for their prudent guidance in bringing out the publication. My sincere appreciation and gratitude to Director and his team of Agriculture Wing for their relentless efforts in preparing this publication in time. I would like to convey my thanks and gratitude to all stakeholders' ministries/ divisions/ departments/ agencies for their continuous support in providing required data. I hope this publication will be a useful data source for decision-makers, planners, scholars and other stakeholders to evaluate the structural development of the country's agricultural economy.

Comments and Suggestions for further improvement of this publication would be gratefully acknowledged and highly appreciated.

Executive Summary

The agriculture sector plays an important role in economic development as well as food security of this highly populated country. Historically, agriculture sector has been prominent for long in Bangladesh. Reliable Statistics is the key to proper planning and successful implementation activities of all sub-sectors of agriculture.

Bangladesh Bureau of Statistics (BBS) provides reliable production statistics of crops for six major and one hundred and forty minor crops since its inception in 1974. BBS also provides bulk of data on crop sub-sector conducting Agriculture Census that is mainly concerned with crop data and limited data of fisheries and livestock sub-sectors. According to Statistics Act 2013, agriculture census will cover all crops, fisheries and livestock sub-sectors with due importance.

The Yearbook of Agricultural Statistics is published annually by the Agriculture Wing of BBS. It is the single largest source of agricultural statistics. This is the 36th series of Yearbook of Agricultural Statistics. The major parts of yearbook are the findings of survey and census conducted by BBS. The relevant statistics that is collected from secondary sources are also incorporated in the Yearbook.

The two year data of six major crops (Aus, Aman, Boro, Wheat, Potato & Jute) and three year data of one hundred and forty minor crops on annual production estimates like area under crop, yield and total production have been published in this yearbook. The crop summary indices and crop damage statistics are also shown.

The statistics of other areas of agriculture sector that are published in the yearbook are; agro-ecological information of the country, land types, soil classification, crop seasons, land use statistics, meteorological information like rainfall, temperature, humidity, major cyclonic storms, agricultural inputs, statistics of livestock, fisheries and forestry, crop prices, export and import data of agricultural products and inputs and major findings of agriculture census-2019.

The extensive coverage of the Yearbook of Agricultural Statistics has increased the usefulness and importance of the book to the policy makers, researchers and all relevant stakeholders.

Chapter 1

INTRODUCTION

1.1 Introduction

Bangladesh is predominantly an agrarian country. Due to its very fertile land and favorable weather, varieties of crop grow abundantly in this country. Agriculture sector contributes about 11.55 percent in FY 2023-24 to the country's Gross Domestic Product (GDP) and employs around 44.42 percent of total labor force (Source: Labor Force Survey 2023 Final Report).

In order to determine evidence-based policy initiatives, agriculture related statistics are essential. The Yearbook of Agricultural Statistics of Bangladesh is an annual publication and source of this kind of statistics. Agriculture Wing of BBS accumulates, compiles and disseminates current crop statistics and other agriculture related data. This Yearbook contains data on crop acreages and production, crop damage, weather variables, agricultural inputs like seeds, fertilizers, agricultural labor wages, irrigation, agriculture holdings, livestock, fisheries, forestry, prices of selected crops and statistics of export-import of agricultural products etc. The objective of this regular publication is to meet the user's demand of current agricultural statistics.

1.2 Method of Crop Production Estimation

1.2.1 Agricultural Statistics

Agricultural statistics consist of structural and annual statistics. The structural statistics are generated collecting data through full count/sample census normally at a regular interval of ten years as per FAO guidelines. The annual agricultural statistics are generated through annual /periodic sample surveys.

The Annual Agricultural Estimation System

The annual agricultural statistics system is designed to:

- Prepare estimate of acreage, yield per acre and production for 146 crops grown in the country;
- Estimate of crop damages caused by floods, cyclonic storms and other natural calamities;
- Prepare monthly agriculture labor wage rate based on monthly agriculture labor wage survey.
- Prepare annual land utilization and irrigation statistics by districts and by different crops; and
- Compile the Yearbook of Agricultural Statistics.

1.2.2 Crop Estimation Reporting System

Selected sample clusters are visited four times in a year and crop-cutting experiments are conducted in due time to estimate the major crops production of Bangladesh. A well-defined Crop Calendar is followed to collect data in the field level throughout the year. The collected data is processed, compiled at BBS headquarters. The findings are disseminated after approval of competent authority.

1.2.3 Type of Estimation Procedure

Both subjective (household-based interview) and objective (direct observation) methods are used to obtain crop estimates. The subjective method denotes the estimates based on impression. The objective method denotes the method of sample survey in which the main items of information are collected mostly through measurement and observation. The estimates of rice, wheat, potato and jute are made by objective method; for all other crops subjective estimation are followed.

1.2.4 The Subjective Estimation Method

Crop estimation is usually initiated at union levels. The upazila statistical office staff collects the union estimates of the area and yield rate of the crop being estimated. These crop estimates are prepared on the basis of assessment of opinions of farmers interviewed and appraisals of the current crop conditions compared with that of the previous year or of a normal year by the field staff of the upazila statistical office. The Agricultural Censuses conducted in 1983-84, 1996, 2008 and 2019 influence the current estimates of crop areas.

In order to have an element of objectivity in estimation, the field offices of BBS collect area and yield rate of a crop by unions on the basis of assessments of reports of 5 local farmers and their observation of condition of crops in the field. Percentage changes of area of yield rate from previous year are determined on information collected from farmers and field staff's own observation of a crop. Thus, the ratio estimation methodology is followed to get current year estimates.

Upazila crop acreage is the arithmetic sum of union crop acreage and yield per acre is the result of weighted average of union estimates. District estimates are evaluated in relation to (1) prices of crops (2) seasonal characteristics, (3) conditions of the growing plants, (4) damages (if any) and (5) previous year estimates. The country estimates are based on district estimates.

1.2.5 The Objective Estimation Method

Cultivations of Aus, Aman, Boro, Wheat, Potato and Jute are widespread. The sample designs of these crops are, therefore, developed considering total land area of the country (excluding urban areas and areas under government reserved forests and big rivers) as universe. Each unit of clusters of plots are sampled across this universe. In order to conduct crop estimation survey for six main crops, BBS uses a total of 10348 clusters each constituted 5 acres of land on an average throughout the country as sample frame. The district is considered as the domain of estimation while the upazilas in a district are considered as strata. The clusters were allocated among the districts proportionally to the size of the district with restriction that the number of clusters in a district is at least 150. At least one cluster was chosen from each union of a upazila. The clusters were formed from cadastral plot listed in the land records. A cluster may have many crops & non-crops plots, each of which has its own identification number referred to ID number. For each cluster, BBS maintains and updates the list of farmers having fields within the cluster as well as other relevant information regarding farming.

1.2.6 Data Collection

The clusters are visited 4 times a year. The acreages of different crops and other utilizations in each cluster are recorded by the field staff in prescribed forms.

1.2.7 Area Estimation

Sample design for estimating the area of each six main crops: For each six crops, stratified two stage random sampling designs are used. The sample design for each main crop is as follows;

Area under particular crop in clusters is given by

$$p = \frac{\text{area under the crop}}{\sum_{i=1}^{Nd} ai} = \frac{a'}{\sum_{i=1}^{Nd} ai}$$

Area under particular crop (each six main crop) in district d is given by

$$\hat{A}_d = NP$$

The cluster term reports are edited, compiled and analyzed in BBS headquarters for estimating areas of Aus, Aman, Boro, Wheat, Potato and Jute crops by varieties separately and combinedly. The total acreage figure of a crop is obtained district wise by using the method of ratio estimation. The acreage estimates of crops by district are obtained by ratio method of expansion as follows;

Area for a crop for the district	=	Effective area for the district	x	Area ratio devoted to the crop for the district

Where,

Effective area for the district	=	Total land area for the district	-	Area not utilized for agricultural purposes for the district

Area ratio devoted to the crop for the district	=	Sum of area devoted to the crop from plots within the clusters for the districts Sum of areas of corresponding clusters for the district

1.2.8 Yield Rate Estimation

For estimating yield rates of the main crops (Aus, Aman, Boro, Wheat, Potato and Jute), sample crop cutting surveys are conducted. A large sub-sample of clusters is taken for each of the survey. The sampling design for yield estimation of each main crop is stratified two-stage random sampling design with different districts in the country serving as domains of study. Different upazilas are considered the strata. In each district 50 (fifty) sample crop cutting experiments are done in the sample cluster. The total number of crop cutting is distributed among the upazilas (sub-districts) according to the proportion of area coverage for each crop in the previous year. The First Stage Units (FSUs) of the sample design are the selection of clusters of land where crop is grown. A field (the smallest demarcated area in a cluster) in the cluster is the second stage

sampling unit (SSU). A plot (crop cutting area) in the field where the crop under study grown is reflected for conducting crop cutting experiment.

District Level Estimate

Weighted average yield of the crop in d-th district,

$$\bar{y}_d = \frac{\sum_h A_{dh} \bar{y}_{dh}}{\sum_h A_{dh}}$$

is the estimator of rice yield for the district

Where, $\bar{y}_d$ = average yield of crop in district d

A_{dh} = total crop area in h-th stratum of district d

$\bar{y}_{dh}$ = average yield of crop in the h-th stratum of district d

The district level variance of yield estimator is given by

$$V(\bar{y}_d) = \frac{1}{A_d^2} \sum_h A_{dh}^2 \left(\frac{1}{n_{dh}} - \frac{1}{N_{dh}} \right) S_{dh}^2$$

The district level estimate of variance is given as:

$$\hat{V}(\bar{y}_d) = \frac{1}{A_d^2} \sum_h A_{dh}^2 \left(\frac{1}{n_{dh}} - \frac{1}{N_{dh}} \right) s_{dh}^2$$

The estimated percentage standard error at the district level is given as:

$$\widehat{CV}_d = \frac{\sqrt{\hat{V}(\bar{y}_d)}}{\bar{y}_d} \times 100$$

Where, N_{dh} = total of fields growing specific crop in h-th stratum of district d

n_{dh} = sample number of fields growing specific crop in h-th stratum of district d

A_d = total estimated area of specific crop in district d

S_{dh}^2 = sample variance from h-th stratum of district d

National Level Estimate

The overall weighted yield estimate at the national level is given by:

$$\bar{y} = \frac{1}{A} \sum_d A_d \bar{y}_d$$

The overall estimate of variance is given by:

$$\hat{V}(\bar{y}) = \frac{1}{A^2} \sum_d A_d^2 \hat{V}(\bar{y}_d)$$

The overall estimated percentage standard error is given as:

$$\widehat{CV} = \frac{\sqrt{\hat{V}(\bar{y})}}{\bar{y}} \times 100$$

Sample Crop Cutting Method of Rice (Aus, Aman & Boro)

The method followed is a circular cut of total area 215.278 sq. ft. (20 sq meters) with a radius of 8.278 ft. In this process one random point is determined and keeping that point in the centre, the circle is delineated by means of an appliance with an arm of fixed length (8.278 ft.) attached to it. A stylus is also attached for marking crop plants to be cut. Rice from the harvested sample plants is threshed and winnowed and green weights are recorded. For recording the moisture, moisture meter is used. In Bangladesh 14% moisture in the case of paddy is considered as standard after drying. The formula for conversion of produce of paddy into rice followed in Bangladesh is given below:

$$\text{Rice} = \text{paddy} \times \frac{2}{3}$$

Sample Crop Cutting Method of Wheat

The sample crop cutting is conducted in the selected plot in the cluster. The sample plot (area of crop cutting) is determined following statistical procedure. The method followed is a circular cut of total area 50 sq. feet (approx.) with a radius of 4 ft. Wheat from the harvested sample plants is threshed and winnowed and green weight and weight after drying is recorded. Thus, the weighted yield of wheat per area is obtained.

Sample Crop Cutting Method of Potato

To conduct sample crop cutting for potato, a field in the randomly selected cluster is randomly selected. As potato is planted in rows, two rows are randomly selected among total. Then the area under selected row is measured through adding the length in feet of each selected row multiplied by the average width per row in the field. Afterwards the Potato for selected two rows are harvested and cleaned. Then taking the harvested area and the weight of harvested Potato into consideration, the yield rate per acre is estimated.

Sample Crop Cutting Method of Jute

The sample crop cutting is conducted in the selected plot of the selected cluster. The sample plot (area of crop cutting) is determined following statistical procedure. The method followed is a circular cut having total area of 50 sq. feet (approx.) with a radius of 4 ft. The bundle of jute is kept under water for few days. After some days the rotten Jute is separated from the stalks, cleaned and dried. Then the weight is taken and the yield per acre is estimated.

1.2.9 Production Estimation

Multiplying area and yield rate figures, production estimates of the crops are derived separately for each district. Country estimates are obtained summing up estimates of districts. Yield rates at country level are all weighted averages of district figures.

AEZ-26: High Barind Tract

It includes the western part of Barind Tract where the underlying Madhupur Clay has been uplifted and cut into by deep valleys.

The soils include paddled silt loam to silty clay loam in the topsoils and porous silt loam with mottled plastic clay at varying depth. Deep Grey Terrace soils and GreyValley soils are the major components of general soil types of the area. General fertility status is low having low status of organic matter.

Location: Rajshahi, Chapainawabgonj and Naogaon districts.

AEZ-27: North Eastern Barind Tract

This region occupies several discontinuous areas on the north-eastern margins of Barind Tract. It stands slightly higher than adjoining floodplain land.

The region has silty or loamy topsoil and clay loams to clay subsoils and grades into strongly mottled clay. The Madhupur Clay underlying this region is deeply weathered. Deep Red Brown Terrace soil and Deep Grey Terrace soils are the major components of general soil types of the area. The soils are strongly acidic in reaction. Organic matter of the soils is low. General fertility level is poor.

Location: Dinajpur, Rangpur, Gaibandha, Joypurhat and Bogura districts.

AEZ-28: Madhupur Tract

This region of complex relief and soils developed over the Madhupur Clay. The landscape comprises level upland, closely or broadly dissected terrace associated with either shallow or broad, deep valleys.

Eleven general soil types exist in the area; of which, Deep Red Brown Terrace, Shallow Red Brown Terrace soils and Acid Basin Clays are the major ones. The soils on the terrace are better drained, friable clay loams to clays overlying friable clay substratum at varying depth. Soils in the valleys are dark grey heavy clays. They are strongly acidic in reaction with low status of organic matter, low moisture holding capacity and low fertility level.

Location: Dhaka, Gazipur, Narsingdi, Narayanganj, Tangail, Mymensingh and Kishoreganj.

AEZ-29: Northern and Eastern Hills

This region includes the country's hill areas. Relief is complex. Hills have been dissected to different degrees over different rocks. In general, slopes are very steep and few low hills have flat summits.

The major hill soils are yellow-brown to strong brown permeable friable loamy, very strongly acidic and low in moisture holding capacity. However, soil patterns generally are complex due to local differences in sand, silt and clay contents of the underlying sedimentary rocks and in the amount of erosion that has occurred. BrownHill soils are the predominant general soil type of the area. Organic matter content and general fertility level is low.

Location: Mainly in Khagrachhari, Chattogram Hill Tracts, Bandarban, Chattogram, Cox's Bazar, Habiganj and Moulvi Bazar districts, small areas along the northern border of Sherpur, Mymensingh, Sunamganj and Sylhet districts in central and south eastern Sylhet and in the east of Brahmanbaria, Cumilla and Feni districts.

AEZ-30: Akhaura Terrace

This small region lies on the eastern border of Brahmanbaria and southwest corner of Habiganj districts. In appearance, the region resembles Madhupur Tract with level upland dissected by mainly deep broad valleys.

The main soils on the upland have strong brown clay which grades into red mottled clay substratum. The valley soils range from silty clay loams to clays. Deep Red Brown Terrace soil, Grey Piedmont soils and Acid Basin Clays are the major components of general soil types of the area. The general fertility including organic matter status is low. The soils are strongly acidic in reaction.

Location: Brahmanbaria district and minor area in Habiganj district.

All the physiographic units and agro-ecological zones are displayed separately on two maps (Map-1 and Map-2).

1.5 Land Levels in Relation to Flooding

The information has been provided in terms of depth of flooding phases. The terms used have the following meanings:

Highland (H)	: Land which is above normal flood-level.
Medium Highland (MH)	: Land which is normally flooded about 90 cm deep during the flood season.
Medium Lowland (ML)	: Land which is normally flooded between 90 cm. and 180 cm. deep during the flood season.
Lowland (L)	: Land which is normally flooded between 180 cm and 300 cm deep during the flood season.
Very Lowland (VL)	: Land which is normally flooded deeper than 300 cm during the flood season.

An additional class, Bottomland, is recognized for depression sites in any land level class which remains wet throughout the year. The Medium Highland land type has been divided into two subclasses: MH-1, normally flooded up to about 30 cm deep; and MH-2, normally flooded between 30 -90 cm deep. Neither these subclasses nor Bottomland are shown separately in the map.

It is important to realize that the depth limits between the depth of flooding classes are not as rigid as the definitions might suggest. Flood-levels in an area may, in fact, vary by as much as a metre or more over different years. They may also reach their peak levels for only a few days at a time during a particular year. They may also reach their peak levels for only a few days at a time during a particular year. What these classes indicate is the level of flooding which farmers expect when they decide which crops to grow in the kharif season on their different kinds of land, based on their long experience of cultivation on particular sites:

Highland may be suitable for kharif or perennial dry land crops if the soils are permeable. Impermeable soils - or soils which can be made impermeable by puddling - may be suitable for transplanted Aus and/or Aman paddy if bunds are made to retain rainwater on fields.

Medium Highland is suitable for crops which can tolerate shallow flooding, such as broadcast or transplanted Aus paddy, jute and transplanted Aman paddy. Early kharif dry land crops which mature before flooding starts can be grown on permeable soils, and late kharif and early rabi dry land crops on soils which drain in September-October.

Medium Lowland is flooded too deeply for transplanted Aus or transplanted Aman paddy to be grown safely. Mixed broadcast Aus and deep-water Aman is a common practice; or long Aman seedlings may be transplanted if floodwater recedes early enough. Dry land rabi crops are widely grown on soils which drain in October or November.

Lowland is flooded too deeply for broadcast Aus or transplanted Aman to be grown. Deepwater Aman is typically grown on such land (although the cultivation of irrigated Boro paddy on such land in the dry season now precludes the cultivation of deep-water Aman over considerable areas of lowland). Dry land rabi crops can only be grown if floodwater recedes before December.

Very Lowland generally is too deeply flooded for even deep-water Aman to be grown (this is not necessary because of the depth of flooding but because of such associated characteristics as early flooding, rapid flooding or wave action on large open bodies of water, as in the Sylhet Basin). Where cultivated, very lowland is generally used for irrigated Boro paddy, either HYV or local varieties.

Bottomland stays too wet for paddy to be sown broadcast. The traditional crop on such land is local Boro paddy, either not irrigated or irrigated by traditional low-lift irrigation devices. In a few other areas where flooding normally does not exceed about 1.5 m deep very long Aman paddy seedlings are transplanted early in the monsoon season.

The above flood-depth classes are shown on the map as subdivisions of the soil units. As with the soil units themselves, it must be realized that the information given on flooding characteristics is highly generalized. It is to be noted that several flood-depth classes can occur within a single village in floodplain physiographic units. But the map shows either the most extensive class (or classes) occurring in the soil unit (e.g., Highland or Highland and Medium Highland) or the range of classes which cover important areas within the unit if more than two classes occur (e.g., Medium Lowland to Very Lowland). Where two classes are named, the more extensive one is named first. Where a range of classes is indicated, they are referred in sequence from highest to lowest position in the landscape, regardless of their relative extents.

1.7 Crop Seasons and Seed Requirements

The country grows a wide variety of crops which are broadly classified, according to seasons in which they are grown into two groups:

(a) Kharif crops

Kharif crops are grown in spring or summer season and harvested in late summer or in early winter.

(b) Rabi crops

Rabi crops are sown in winter and harvested in the spring or in early summer.

Time of sowing, transplanting, time of harvest and per acre seed requirement of different crops are given in the next page.

1.9 Physiography of Bangladesh

Bangladesh forms the largest delta in the world and is situated between 88°10' and 92°41' East longitudes and between 20°34' and 26°38' North latitudes. The great delta is flat throughout and stretches from near the foot-hills of the Himalayan Mountains in the north to the Bay of Bengal in the south.

The vast plain is washed by mighty rivers-the Meghna, the Padma, the Jamuna and the Karnafuli and their numerous tributaries. Tropical monsoon rains drench the land and the rivers. Onrush of rain waters in summer overflows their banks flooding low and outlying areas every year.

The monotony of flatness has been relieved inland by two elevated tracts-the Modhupur and the Barind tracts, and on the north-east and south-east by rows of hilly forests. The great plain lies almost at sea level along the southern coast and rises gradually towards north. The maximum elevation above the mean sea level is 4034 feet at Keocradang Hill in Rangamati Hill district. The topography, however, variable and can be divided into the following five classes.

1. High Land

The area is relatively high and cannot hold waters during monsoon. Some waters are retained by raising "bandhs" around fields. The area spreads over Modhupur Garh in Tangail and Mymensingh district, Bhaoal's Garh in Gazipur and Dhaka district, Barind tract in Rajshahi Division, Lalmai area in Comilla and "Tilla" areas in Sylhet, Moulvi Bazar and Habiganj district.

2. Medium Highland

The land which is normally flooded up to about 90 cm. depth during the rainy season for more than two weeks continuously. The area spreads over Barishal division, major parts of Khulna division, northern part of Rajshahi division and parts of Gazipur, Narsindi, Noakhali, Feni, Lakshmipur, Comilla and Habiganj district.

3. Medium Lowland and Low Land

Medium Lowland is normally flooded between 90cm. and 180 cm. depths and low land is normally flood between 180cm. and 275 cm. depth during the monsoon season. The area spreads over major parts of Cumilla, Brahmanbaria, Chandpur, Gopalganj district and parts of Laksmipur, Noakhali, Serajganj, Natore and Naogaon district, northern parts of Khulna and Bagherhat district, minor of Jashore, Kishorganj and Habiganj district.

4. Very Low Land

The land consists of haors, bills, canals and other low-lying areas which looks like large lakes during rainy season. Depth of water may rise as high as 30 feet. In winter, waters dry up except in the centre. Most of the haors and bills lie in Sylhet division and in Kisoreganj and Netrokona district.

5. Hilly Land

The land spreads over Rangamati, Bandarban and Khagrachari Hill Districts, parts of Chattogram, northern parts of Mymensingh, north and southern parts of Sylhet division, eastern border of Comilla and north eastern strip of Feni district.

F.N They often differ slightly from the totals of the rounded figures of corresponding individual crops. Likewise, yield rates correspond to full figures of area and production and hence most cases they differ slightly from yield corresponding to rounded area and production figures.

(2) .. indicates negligible.

(3) - indicates 'nil'

Estimates of Aus Crops 2023-24

Introduction:

Aus is one of the major crops in Bangladesh. It has been contributing to food production in addition to other two rice-Aman and Boro. But the Aus production is comparatively lower due to its lower productivity as compared to two other rice crop Aman and Boro. As the contemporary crops are becoming profitable and available, cultivation of those crops is increasing day by day.

Area:

Total area under Aus crop has been estimated at 10,34,770 Hectors in FY (2023-24) as compared to 10,61,273 Hectors in FY (2022-23), which is 2.50% lower than that of FY (2022-23). Comparative area estimates are shown below:

Estimates of Total Area by Type of Aus Crops

Yield Rate:

In fiscal year (2023-24), the yield rate has been estimated at 2.873 metric tons / hector, which is 5.08% higher than that of 2022-23. Estimates of yield rates by varieties and combined average yield rate of Aus crops in FY (2022-23) and FY(2023-24) are as follows:

Estimates of Aman Crops 2023-24

Introduction:

Aman is one of the main crops in Bangladesh. It has been contributing to food production in addition to other two rice, Aus and Boro. As the contemporary crops are becoming profitable and available, cultivation of those crops is increasing day by day. Besides, this year Cyclone “Bulbul” brings damages to Aman crops in some of the places, that’s why the area has been decreased in comparing with the last year but production increased due to high yield rate.

Area:

Total area under Aman crop has been estimated 57,50,755 Hectors in FY (2023-24) as compared to 57,24,822 Hectors of FY (2022-23). The harvested area has increased by 0.453% this year. Comparative area estimates are shown below:

Estimates of Boro Crops 2023-24

Introduction

Boro is the most important and single largest crop in Bangladesh in respect of volume of production. It has been persistently contributing to higher rice production in last successive years. The weather condition for Boro cultivation was favourable in the growing stage this year. In a subjective manner, farmers were interviewed on some points relating to management system of seed, fertilizer and rural electricity supply. They opined that proper management and timely distribution of seed, fertilizer and stable supply of electricity led to a substantial higher production of Boro this year.

Area

Total area under Boro crop has been estimated 48,77,775 Hectors this year 2023-24 as compared to 48,52,290 Hectors of the last year 2022-23. The harvested area has increased by 0.53% this year. Comparative area estimates are shown below:
