Preface

Implementing ICD-10 codes for diagnosis and reporting in Bangladesh was a long lasting challenge faced by the Government. However, remarkable progress has been achieved in a relatively short period of time through initiatives taken by the Management Information System (MIS) of the Directorate General of Health Services (DGHS) under the Ministry of Health and Family Welfare (MoHFW) of Bangladesh with supports from the World Health Organization (WHO). ICD-10 based morbidity and mortality reporting for the indoor patients of all public hospitals is now a part of the routine health information system (HIS) which is developed and being maintained by the MIS. District Health Information System (DHIS2), the HIS backbone of the country, has been customized to capture ICD-10 based diagnoses of individual indoor patients of the hospitals, both public and private. We are providing related training to the doctors, nurses and the statisticians to facilitate the implementation. This guide book is playing an instrumented role in promoting the use of ICD-10.

In the upcoming post-MDG era, universal health coverage (UHC) will be the priority health agenda for which using standard based diagnostic codes by all concerned entities will be an essential prerequisite. ICD-10 is so far the most suitable candidate for the standard diagnostic codes and hence we should now speedup the implementation process across the country.

To meet the increasing demand of this Guidebook on ICD-10, we are going to publish this 3rd edition with the financial support of WHO, Bangladesh country office. I am thankful to our professional colleagues who assisted us to and revise the publication.

I am also grateful to DR N. Paranietharan, the WHO Representative of Bangladesh country office for his support and cooperation in relation to the publication.

Message

I am glad to know that the third edition of the Guidebook on ICD-10 is going to be published by the Management Information System (MIS) of the Directorate General of Health Services (DGHS). I believe that the guidebook will serve as an important tool to the clinicians and other personnel involved in implementing ICD-10 for diagnosis as well as morbidity and mortality reporting.

We cannot over emphasize the importance of using ICD-10, the de facto global standard of disease classification, especially for the purposes of documentation and reporting from every healthcare entity of the country, be it public or private. Unfortunately, we are not yet very successful in ensuring the adoption of ICD-10 by all healthcare organizations. Lack of adequate human resources is obviously one of the most practical reasons for this. We should not worsen the over-burdened human resource situation by engaging a part of them exclusively for coding nor can we readily afford to appoint coders in all hospitals. Hence at present we are relying on the clinicians for the coding. I sincerely believe that our physicians are well capable to quickly learn the coding procedure. The MIS of DGHS, with support from WHO - Bangladesh are providing training on ICD-10 in a regular basis and this guidebook will support the capacity building.

I hope that the clinicians will utilize the guidebook as well as other online tools and resources so that they can correctly encode all the diseases and conditions. By this their clinical skill will also be improved. The success of Bangladesh in full implementation of ICD 10 coding in all level of health services both public and private level is largely depending on the clinicians and the statistical staffs. Both of the groups will be benefited by this publication. The field level statistics will guide us to the right direction. Hope the data quality in case of reporting with ICD 10 will be improved day by day. I express special thanks to WHO for their supports in such a critical area of reporting and documentation. I also thank my colleagues at MIS-Health for their hard work in relation to this publication.

Message

I am pleased to learn that the third edition of the guide book for International Classification of Diseases (ICD-10) is being published in Bangladesh. ICD-10 has been developed by the World Health Organization (WHO) which is now used world-wide for morbidity and mortality statistics, reimbursement systems and automated decision support in medicine.

The main purpose of ICD is to harmonize medical recording practices worldwide. ICD-10 was adopted by the World Health Assembly in May 1990 and we expect that all government and private health and medical institutions in the country essentially use this version in preparing their records and reports. All medical and health institutions, including hospitals in the country should equip themselves with the WHO publication on ICD-10 as a reference and we request the authorities to plan regular orientations on the use of it. I believe that implementation of ICD-10 will have a positive impact on the entire value chain of healthcare including insurance, service delivery, scheduling, patient registration, patient care, customer service, revenue and reimbursement management, network management and risk management.

With regard to achieving the objective of ICD-10, it is important for the concerned health managers, medical teachers, consultants and institute heads to play their roles proactively. I hope that this valuable publication will guide and facilitate them to perform their roles and responsibilities.

I would like to extend my sincere appreciation to all those in the Directorate General of Health Services who have contributed to the development and publication of this valuable guide.

Dr N. Paranietharan
WHO Representative to Bangladesh

What do we understand by ICD?

ICD stands for International Statistical Classification of Diseases and Related Health Problems. This classification system has been developed by the World Health Organization (WHO). ICD is used world-wide for morbidity and mortality statistics, reimbursement systems and automated decision support in medicine. The design of ICD promotes international comparability in the collection, processing, classification and presentation of morbidity and mortality statistics.

ICD contains only diagnosis codes and the classification is used to translate diagnosis of diseases & other health problems from clinical text into an alphanumeric codes. It permits easy storage, retrieval and analysis of the data. WHO revises the ICD code-set periodically and it is currently in its 10th edition, which was introduced by WHO in 1993.

ICD-10 comprises three volumes:

1. Volume 1 contains the main classifications;
2. Volume 2 provides guidance to users of the ICD; and
3. Volume 3 is the Alphabetical Index to the classification.

Volume 1 is the Tabular list, which is an alphanumeric listing of diseases and disease groups, at the three- and four-character levels. It also includes the classification of the morphology of neoplasms along with inclusion and exclusion notes, special tabulation lists for mortality and morbidity, definitions and the nomenclature regulation.

Volume 2 is the Instruction Manual. It provides:

- An introduction to and instructions on how to use Volume 1 and 3
- Guidelines for certification and rules for mortality coding;
- Guidelines for recording and coding for morbidity coding;
- Statistical presentation.

Volume 3 is the comprehensive Alphabetical index of the diseases and conditions found in the Tabular list. Volume 3 is divided into three sections as follows:

- ❑ Section I lists all the terms classifiable to Chapters I-XIX and Chapter XXI;
- ❑ Section II is the index of external causes of morbidity and mortality and contains all the terms classifiable to Chapter XX, except drugs and chemicals;
- ❑ Section III, it contains an alphabetically arranged table of drugs and chemicals (codes for poisonings and adverse effects of drugs classifiable to Chapter XIX, and the Chapter XX). Codes that indicate whether the poisoning was accidental, deliberate (self-harm), undetermined, or an adverse effect of a correct substance properly administered.

Global ICD-10 adoption

The current version of ICD is ICD-10, which was adopted by the World Health Assembly in May 1990. It is learnt that 138 countries have implemented the ICD-10 code set for mortality, and 99 of them have also implemented ICD-10 for morbidity. Individual country, on permission from WHO, may make modification to ICD-10 to meet individual country-specific needs. For example, Canada and Australia each has a national version of the ICD-10 code set. Likewise, WHO granted permission to the United States to develop a national clinical modification of ICD-10. The effort involved the United States National Center for Health Statistics (NCHS) and the Centers for Medicare and Medicaid Services (CMS). The NCHS created ICD10-CM, which contains diagnosis codes. The ICD10-Procedure Coding System (PCS) was developed for CMS, which contains the procedure codes for use in reimbursement of in-patient hospital services. The ICD10-CM code set is five times larger than the code sets being used in other countries. Currently DGHS, Bangladesh has started adopting ICD-10 Code for indoor morbidity and mortality reporting through web-based system.

ICD-10 based morbidity and mortality reporting from public hospitals

All the public hospitals of Bangladesh are supposed to use ICD-10 codes for morbidity and mortality reporting. In the yearly Local Health Bulletins which are published online every year from 2012, each of the government hospitals ranging from Upazila Health complex to Medical college Hospitals and other specialized tertiary hospitals are already using ICD-10 codes for aggregate level morbidity and mortality reporting.

The Management Information System (MIS) of the Directorate General of Health Services under the Ministry of Health and Family Welfare (MoHFW) has developed the technological platform for online entry of individual indoor patients' information and ICD-10 codes are also used here. Corresponding module for entering individual patients' information in the District Health Information System (DHIS) is now functioning and many hospitals are already using the module. Doctors will write ICD-10 codes for diagnosis or cause of death in the paper file of each indoor patient and the nurses will enter the code in the electronic form of the corresponding patient using the DHIS platform. The MIS is also providing training to the doctors, nurses and statisticians to facilitate full scale implementation of ICD-10 based reporting.

Advantages of implementing ICD-10

- Measuring the quality, safety (or medical errors) and efficacy of care
 - Making clinical decisions based on output from multiple systems
 - Conducting research, epidemiological studies and clinical trials
 - Comparability between health facilities, regions and countries
 - Setting health policy
 - Designing healthcare delivery systems
 - Monitoring resource utilization
 - Improving clinical, financial and administrative performance
 - Identifying fraudulent or abusive practices
 - Managing care and disease processes
 - Tracking public health and risks
 - Providing data to consumers regarding costs and outcomes of treatment options
- Implementation of ICD-10 will impact the entire chain of healthcare including insurance, service delivery, scheduling, patient registration, patient care, customer service, revenue and reimbursement management, network management and risk management.

How to use ICD

ICD has become the international standard diagnostic classification. To harmonize our medical practice, we should learn and use ICD while caring our patients. It uses codes to represent different diagnoses, procedures or life events. Essentially, all medical practitioners need to understand the ICD.

The WHO has published three volumes on ICD. The volume I provides a tabular list of diseases and health problems. The volume II is the instruction manual on how to use the ICD. The Volume III is the alphabetical list of ICD. In ICD-10, there are more than 14,400 different codes. It allows tracking of many new diagnoses. Using optional sub-classifications, the codes can be expanded to over 16,000 codes.

The ICD is sub-divided into chapters, blocks, 3-digit codes and 4-digit codes. Further sub-classification like 5-digit codes and 6-digit codes also exist. Below is a listing of Chapters, Block groups and Chapter title. There are 21 chapters in ICD - 10 but there is a provision of another chapter (22) which is being kept for including new codes which are unavailable in the existing ICD.

XX	V01-Y98	External causes of morbidity and mortality
XXI	Z00-Z99	Factors influencing health status and contact with health services
XXII	U00-U99	Codes for special purposes

Chapters I to XVII list different diagnoses related to different body systems. Chapter XVIII lists symptoms, signs and abnormal laboratory findings that are not mentioned elsewhere.

Chapter XIX lists injury, poisoning and certain other consequences of external causes. Chapter XX lists external causes of morbidity and mortality. Chapter XXI lists factors influencing health status and contact with health services. Chapter XXII keeps provision for inclusion of new codes which are unavailable in the existing ICD.

Each chapter has been divided into **blocks** of related conditions. Some blocks have 3 character categories for single condition. Other blocks contain groups of related diseases.

Chapters

The classification is divided into 21 chapters. The first character of the ICD code is a letter, and each letter is associated with a particular chapter, except for the letter D, which is used in both Chapter II (Neoplasms), and Chapter III (Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism). Similarly, the letter H, which is used in both Chapter VII (Diseases of the eye and adnexa) and Chapter VIII (Diseases of the ear and mastoid process). Four Chapters (Chapters I, II, XIX and XX) use more than one letter in the first position of their codes. Each chapter contains sufficient three-character categories to cover its content; not all available codes are used, allowing space for future revision and expansion.

Blocks of categories

The chapters are subdivided into homogeneous 'blocks' of three-character categories.

Three-character categories

Within each block, some of the three-character categories are for single conditions, selected because of their frequency, severity or susceptibility to public health intervention, while others are for groups of diseases with some common characteristic.

Four-character subcategories

Although not mandatory for reporting at the international level, most of the three-character categories are subdivided by means of a fourth, numeric character after a decimal point, allowing up to 10 subcategories. Where a three-character category is not subdivided, it is recommended that the letter 'X' be used to fill the fourth position so that the codes are of a standard length for data-processing.

Rubric : In the context of the ICD, "rubric" denotes either a three-character category or a four-character sub-category.

Following list shows different blocks under Chapter I. List of all blocks has been provided in appendix (A). Please note that each block has a title.

Chapter I: Certain infectious and parasitic diseases (A00-B99)

A00-A09	Intestinal infectious diseases
A15-A19	Tuberculosis
A20-A28	Certain zoonotic bacterial diseases
A30-A49	Other bacterial diseases

B85-B89	Pediculosis, ascariasis and other infestations
B90-B94	Sequelae of infectious and parasitic diseases
B95-B97	Bacterial, viral and other infectious agents
B99	Other infectious diseases

How each ICD block is constituted?

Please see the first block above. It begins at code A00 and ends at code A09. It titles "Intestinal Infectious Diseases". The block is an alphanumeric character block, where the first character is a CAPITAL LETTER and the next two characters are numeric. Either A00 or A09 constitutes a 3-digit ICD code. All the 3-digit ICD codes for block A00-A09 are mentioned below:

- A00 Cholera
- A01 Typhoid and paratyphoid fevers
- A02 Other salmonella infections
- A03 Shigellosis
- A04 Other bacterial intestinal infections
- A05 Other bacterial foodborne intoxications, not elsewhere classified
- A06 Amoebiasis
- A07 Other protozoal intestinal diseases
- A08 Viral and other specified intestinal infections
- A09 Diarrhoea and gastroenteritis of presumed infectious origin

3-digits vs. 4-digits ICD codes

We have seen above, example of 3-digits ICD codes. Let us consider A00. It is the 3-digits ICD code for Cholera. It does not tell specifically, which type of cholera it is, classical or el tor, or unspecified. A 4-digits ICD code answers this question. The table below shows how 3-digits ICD codes are broadened into 4-digits ICD codes to enhance the specificity.

3-digit code	4-digit code	Name
A00		Cholera
	A00.0	Cholera due to <i>Vibrio cholerae</i> 01, biovar cholerae Classical cholera
	A00.1	Cholera due to <i>Vibrio cholerae</i> 01, biovar eltor Cholera eltor
	A00.9	Cholera, unspecified
A01		Typhoid and paratyphoid fevers
	A01.0	Typhoid fever Infection due to <i>Salmonella typhi</i>
	A01.1	Paratyphoid fever A
	A01.2	Paratyphoid fever B
	A01.3	Paratyphoid fever C
	A01.4	Paratyphoid fever, unspecified Infection due to <i>Salmonella</i> paratyphi NOS (not otherwise specified)

It is easy to understand the difference between 3-digits and 4-digits ICD codes. The 3-digits code begins with a Capital letter followed by two numeric characters (example: A00 Cholera). The 4-digits code, on the other hand, adds with the 3-digits code with a dot (.) plus another numeric character, example: A00.0 Cholera classical; A00.1 Cholera el tor. In 4-digits code, the (.) mark is not considered as a digit. The 'core' classification- the list of three character categories is the mandatory level for reporting to the WHO mortality database and for general international comparison. This core classification also lists chapter and block lists.

Why to write the ICD-10 code

- Use of ICD-10 codes are mainly required to classify causes of mortality and morbidity
- ICD is important because it provides a common language for reporting and monitoring diseases This allows comparing and sharing of data in a consistent and standard way between hospitals regions and countries over periods of time
- The MIS-Health has introduced a web based reporting system for collection of information according to ICD-10 for all indoor patients
- Use of ICD-10 codes will be integral part of this system.

Who to write the ICD-10 code

- The doctor in-charge of the patient will have the primary responsibility to write the ICD-10 code. Otherwise, the doctor who is writing the discharge, transfer, referral or death certificate of the patient will have to write or complete the ICD-10 code.
- The doctor writing the ICD-10 code should write his/her name legibly so that he/she can be traced for clarification or completing the incomplete write up.
- The responsibility of ensuring ICD 10 code writing will be up on the supervisor or in-charge of the unit (RMO/Asst Registrars / Registrars / Specialists / Consultants / Unit heads / UH & FPOs / Civil surgeons / Superintendents /Directors).
- The completed case-sheet with ICD-10 code on discharge, transfer, referral or death of patient will go to the medical record room for entry into national database. In time, this will be done through hospital ward where the patient will receive treatment. In case of incomplete or no ICD-10 code, the case-sheet will be returned to the corresponding doctor for completing the job.

Correct way for assigning a code

1. Identify the type of statement to be coded and refer to the appropriate section of Volume 3 (Alphabetical Index):
 - If the statement is a disease or injury or other condition classifiable to Chapters I-XIX or XXI, refer to the section I of the Index.
 - If the statement is an external cause of injury or other event classifiable to Chapter XX, refer to section II.
 - If the statement is an external cause but specific to drugs, chemicals and other substances, refer to section III
2. Locate the lead term in the Alphabetical Index (Volume 3). Lead terms are usually nouns rather than adjectives or the anatomical site, although a few adjective and eponyms are indexed as lead terms.
3. Read and be guided by any note that appears under the lead term.
4. Read any term enclosed in parentheses after the lead term as well as any terms intended under the lead term. Until all the terms in the diagnostic statements have been located.
5. Follow carefully any cross-references found in the Index.
6. Refer to Volume (Tabular list) to verify the suitability of the code selected.
7. Be guided by any inclusion or exclusion terms under the selected code or under the chapter. Block or category heading.
8. Assign the code. Be sure to list the main condition code first for morbidity coding and the underlying cause code for mortality coding.

It is imperative that Volume 1 and Volume 3 should be used together in locating codes to accurately describe each clinical case.

Coders should not fall into the trap of coding straight from the Alphabetical index or browsing around the Tabular list looking for a code that seems to fit the case being coded.

Example :

A patient has been suffering from both Aortic stenosis and Mitral incompetence

Condition	Index (volume 3)	Tabular (volume 1)
Patient diagnosed with aortic stenosis with mitral incompetence	I35.0 (Aortic Stenosis)	I08.0 (Disorders of both Mitral and Aortic valves)
	I34.0 (Mitral Incompetence)	

For proper coding one should finally go through volume 1. **Example :**

A 58 years old male was admitted with retrosternal dysphagia. An endoscopy with biopsy was performed which indicated what he was suffering from---Candida Oesophagitis as well as Gastric erosions.

Condition	Disease name (volume 1)	ICD 10 Code
Main condition (M.C)	Oesophagitis	K20
Other condition (O.C)	Candidiasis of other sites	B37.8
Other condition (O.C)	Gastric ulcer (Including erosion)	K25.9

How to write ICD-10 code

When coding one must use the Alphabetical index as well as the Tabular list. The following guidelines should be followed when coding using ICD-10:

It is advised that each hospital ward will make a seal with the following information from the hospital's own local fund. Simple hand writing is also acceptable. However, all hand writings must be clear and legible and the completed format must be present in the admission case sheet.

There may be question like, why so many information to provide? Can we not simply go for writing 3-digits code or 4-digits code directly? There are two reasons for requesting the information. First, to keep provision for cross-checking so that mistakes are identified and corrected. Second, to guide the doctor to follow the steps in sequence to easily find the correct ICD code. To explain further, begin from Chapter Name and identify which chapter the patient's diagnosis represents. Identify the blocks and go to respective block. Then go to the 3-digits code. Finally, explore the 4-digits code, if you could further specify your diagnosis or intervention.

If we examine the ICD codes, we will understand that to write 4-digits code, one will need to do specific diagnosis further down from 3-digits code. In primary care setting, even determining 3-digits code may appear difficult due to lack of adequate diagnostic facilities. However, we should remember that the international obligation is to write at least 3-digits code. To compromise with the shortcomings of interim period, based on the information available, the respective ICD-10 information boxes may be filled up. For example, only Chapter No. and Block No. up to 3-digits code along with disease name may be sufficient. Doctors should be inquisitive to explore information as best as possible to be comfortable to write the 4-digits code. This will improve their clinical abilities.

ICD coding for morbidity

- The main condition is the diagnosis established at the end of the episode of health care
- The condition primarily responsible for the patient receiving treatment or being investigated i.e. that condition which is determined as being mainly responsible for the episode of health care.
- Other conditions are defined as those that coexist or develop during the episode of health care and affect the management of the patient.

Two codes for certain conditions (Dual Coding)

The "dagger and asterisk" system ICD 9 introduced a system, continued in ICD 10, whereby there are two codes for diagnostic statements containing information about both an underlying generalized disease and a manifestation in a particular organ or site which is a clinical problem in its own right.

The primary code is for the underlying disease and is marked with a dagger(†); an optional additional code for the manifestation is marked with an asterisk(*). It is a principle of the ICD that the dagger code is the primary code and must always be used. For coding, the asterisk code must never be used alone. However for morbidity coding, the dagger and asterisk sequence may be reversed when the manifestations of a disease is the primary focus of care. The areas of the classification where the dagger and asterisk system operates are limited; there are 83 special asterisk categories throughout the classification.

Example: A patient has been admitted with long standing insulin dependent diabetes mellitus with problem of cataract. Diagnosis: Diabetic cataract. It has two codes one in chapter VII and another in chapter IV.

Diabetic cataract H 28.0 (*)
IDDM with ophthalmic complication E10.3(†).

Asterisk categories

The following asterisk categories are not to be used alone; they must always be used in addition to a dagger code:

D63*, D77*, E35*, E90*, F00*, F02*, G01*, G02*, G05*, G07*, G13*, G22*, G26*, G32*, G46*, G53*, G55*, G59*, G63*, G73*, G94*, G99*, H03*, H06*, H13*, H19*, H22*, H28*, H32*, H36*, H42*, H45*, H48*, H58*, H62*, H67*, H75*, H82*, H94*, I 32*, I 39*, I 41*, I 43*, I 52*, I 68*, I 79*, I 98*, J17*, J91*, J99*, K23*, K67*, K77*, K87*, K93*, L14*, L45*, L54*, L62*, L86*, L99*, M01*, M03*, M07*, M09*, M14*, M36*, M49*, M63*, M68*, M73*, M82*, M90*, N08*, N16*, N22*, N29*, N33*, N37*, N51*, N74*, N77*, P75*.

International Classification of Diseases for Oncology (ICD-O)

The International Classification of Diseases for Oncology (ICD-O) has been used for nearly 40 years, principally in tumor or cancer registries, for coding the site (topography) and the histology (morphology) of the neoplasm, usually obtained from a pathology report. It is a special adaptation of Chapter II (Neoplasms) of ICD.

Differences between ICD-O and ICD-10

There are basic differences between the structure of ICD-O and that of ICD.

In Chapter II (Neoplasms) of ICD, the topography code describes the behavior of the neoplasm (malignant, benign, in situ, or uncertain whether malignant or benign) by assigning it to a specific range of codes identifying each of these types of behavior. As a result, in ICD-10, five different categories of four characters each are needed to describe all lung neoplasms (see Table1).

Very few histological types are identified in ICD. For example, there is no way in ICD to distinguish between an adenocarcinoma of the lung and a squamous cell carcinoma of the lung: both would be coded to C34.9.

Table 1 ICD-10 alphabetic index entry for lung neoplasms

	Malignant	Secondary or metastatic	In situ	Benign	Uncertain and unknown
Lung	C34.9	C78.0	D02.2	D14.3	D38.1

Table 2 ICD-O coding of lung neoplasms

Term	Topography code	Morphology code
Malignant neoplasm of the lung (such as carcinoma)	C34.9	8010/3
Metastatic neoplasm of the lung (such as a metastatic seminoma from the testis)	C34.9	9061/6
In situ neoplasm of the lung (such as squamous carcinoma in situ)	C34.9	8070/2
Benign neoplasm of lung (such as adenoma)	C34.9	8140/0
Uncertain behavior of neoplasm of lung (such as peribronchial myofibroblastic tumor)	C34.9	8827/1

ICD-O Behavior Code and Corresponding Section of Chapter II, ICD-10

The following table shows the correspondence between the behaviour code and the different sections of Chapter II.

Behaviour code		Chapter II categories
/0	Benign neoplasms	D10-D36
/1	Neoplasms of uncertain or unknown behaviour	D37-D48
/2	In situ neoplasms	D00-D09
/3	Malignant neoplasms, stated or presumed to be primary	C00-C76 C80-C97
/6	Malignant neoplasms, stated or presumed to be secondary	C77-C79

ICD-O coding method

Topography - numerical list _

The topography section has been adapted from the malignant neoplasm section of Chapter II of ICD - 10. These topography terms have four-character codes that run from C00.0 to C80.9. A decimal point (.) separates subdivisions of the three-character categories (Table 2).

Table 2 Structure of topography code	
C _____	_____
site	subsite
Example C50.2

Morphology - numerical list

The morphology section of ICD-O, first and second editions, has been revised. New terms have been added and the non-Hodgkin lymphoma and leukemia sections have been revised on the basis of the WHO Classification of Hematopoietic and Lymphoid Diseases. The numerical list displays the structure of the coded morphology nomenclature and constitutes the primary point of reference for retrieval or decoding.

In revising the morphology section, every effort has been made to include new terms that have appeared in the recent literature. In several instances the terms for neoplasms from more than one classification scheme have been included, for example malignant lymphomas (M-959 through M-971).

Morphology terms have five-digit codes ranging from 8000/0 to 9992/3. The first four digits indicate the specific histologic term (Table 3). The fifth digit, after the slash or stroke (/), is a behavior code, which indicates whether a tumor is malignant, benign, in situ, or uncertain whether malignant or benign.

Table 3 Structure of a morphology code	
_____/____	_____
histology	behavior grade
Example: well-differentiated adenocarcinoma	
M-8140 / 3 1	
Tumor/cell type [adeno-]	Behavior [carcinoma]
	Differentiation [well-differentiated]

A separate one-digit code for histologic grading or differentiation is provided. For a lymphoma or leukemia, this element of the code is used to identify T-, B-, Null-, and NK-cell origin.

A complete ICD-O code thus requires 10 digits or characters to identify the topographic site (4 characters), morphologic type (4 digits), behavior (1 digit), and grade or differentiation of a neoplasm or its equivalent in leukemias and lymphomas (1 digit). Table 4 provides an example.

Table 4 Structure of a complete code

Diagnostic term:

Poorly differentiated squamous cell carcinoma, upper lobe of lung

C34.1

8070/33

The behavior of a tumor is the way it acts within the body. Pathologists use a variety of observations to determine the behavior of a tumor. A tumor can grow in place without the potential for spread (/0, benign); it can be malignant but still growing in place (/2, noninvasive or in situ); it can invade surrounding tissues (/3, malignant, primary site); or even disseminate from its point of origin and begin to grow at another site (/6, metastatic).

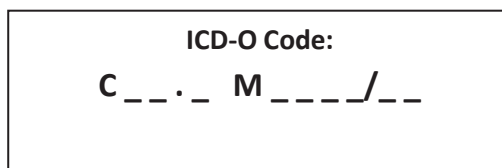

The morphology code numbers consist of five digits; the first four identify the histological type of the neoplasm and the fifth, following a slash or solidus, indicates its behaviour. The one-digit behaviour code is as follows:

Table 5: Behavioural code

/0	Benign
/1	Uncertain whether benign or malignant Borderline malignancy Low malignant potential
/2	Carcinoma in situ Intraepithelial Noninfiltrating Noninvasive
/3	Malignant, primary site
/6	Malignant, metastatic site Malignant, secondary site
/9	Malignant, uncertain whether primary or metastatic site

Histologic Grading and Differentiation (6th Digit)

ICD-O includes, as the 6th digit of the morphology code, a single-digit code number designating the grade or differentiation of malignant neoplasms as listed in Table 5. Only malignant tumors are graded. The code numbers 1 to 4 are used to designate grades I to IV respectively. Words used to designate degrees of differentiation are listed in a separate column.

Writing Medical Certification of Cause of Death (Mortality Coding)

In 1967, the Twentieth World Health Assembly defined the cause of death to be entered in the Medical Certification of Death as, "all those diseases, morbid conditions or injuries which either resulted in or contributed to death and the circumstances of the accident or violence which produced any such injury".

An International Form of Medical Certification of cause of Death (please see in the next page) has been developed and is in practice in most countries of the world. Unfortunately, this issue was not brought into due attention earlier in our country. For reporting and documentation a seal should be prepared in the following way attached to the admission case sheet.

International Form of Medical Certification of Cause of Death -

	Cause of death	Approximate Interval between onset and death
I. Disease or condition directly leading to death*	(a) (Due to or as a consequence of)	
Antecedent Causes Morbid conditions, , if any, giving rise to the above cause, stating the underlying Condition last	(b)..... (Due to or as a consequence of)	
	(c)..... (Due to or as a consequence of)	
	(d)..... (Due to or as a consequence of)	
II. Other significant conditions contributing to the death, but not related to the disease or Conditions causing it		
*This does not mean the mode of dying, e.g. heart failure, respiratory failure. It means the disease, injury, or complication that caused death		

Underlying cause of death (UCOD)..... ICD -10 code.....

Mortality Code Seal

The death certificate is divided into three sections:

1. Part I- including diseases or conditions directly leading to death and antecedent causes
2. Part II- other significant conditions
3. A column to record the approximate interval between onset and death.

Concept of underlying cause of death:

Mortality statistics are based on the underlying cause of death, which is the disease or injury that initiated the sequence of events that led directly to death. Many Death Certificates give only a single cause of death. These are relatively simple to deal with and all you have to do is to code the single cause. However, in many other cases, two or more morbid conditions contribute to death. These must all be recorded on the certificate. In such cases it has been the practice in vital statistics to select one of the causes of death for coding and reporting purposes. This single cause is called the Underlying Cause of Death. The concept of the underlying cause of death is central to mortality coding.

WHO has defined the underlying cause of death as:

- The disease or injury which initiated the train of morbid events leading directly to death; OR
- the circumstances of the accident or violence which produced the fatal injury.

The person certifying the cause of death will enter the sequence of events leading to death on the death certificate in the international format specified by WHO.

The disease or circumstances or accident/ violence which start the chain, is the Underlying cause of Death and the subsequent event in the chain are called as Antecedent Cause and Immediate Cause of Death, in that order. The entire sequence gives the complete picture of the cause of death. The medical practitioner or other qualified certifier should use his or her clinical judgment in completing the medical certificate of cause of death. Automated Systems must not include lists or other prompts to guide the certifier as these necessarily limit the range of diagnoses and therefore have an adverse effect on the accuracy and usefulness of the report. If there is only one step in the chain of events, an entry at line I(a) is sufficient. If there is more than one step, the direct cause is entered at (a) and the originating antecedent cause is entered last, with any intervening cause entered on line (b) or on lines (c).

The condition recorded on the lowest used line of part I of the certificate is usually the underlying cause of death used for tabulation.

With the improvement and growing demand of health information system, it is now a necessity that Bangladeshi hospitals will conform to the international standards of death certification and meet international obligation of death reporting for statistical purposes. Therefore, it has been decided that an Internationally Standard Medical Certification of cause of Death Form will have to be enclosed with the deceased's case-sheet in case of any death event. The doctor writing the death certificate will have to complete the standard medical certification form.

How to complete the Standard Medical Certification Form?

The Standard Medical Certification Form has three important sections: Part I for statement on causes of death having direct relation; Part II for statement of conditions that may contribute to death but not directly related to factors causing death; and another section to write the interval between specific event and death. The Part I has two sub-sections: Disease or condition directly leading to death; and Antecedent causes (i.e., morbid conditions, if any, giving rise to the above cause, stating the underlying condition last).

If we begin with the immediate cause of death, that may be a condition, like pulmonary embolism or coma. In box(a), we may write this condition with the interval of time between this condition and death in the right column (please see next page).

Why the condition in box(a) has occurred? Look for the cause and mention in box(b) with interval in right column. What led to the condition in box(b)? Look for the cause and mention in box(c) with interval in right column. Go to the last box(d) in part I and mention the underlying cause with interval in right column.

Please remember that you may not be required to fill all the boxes. This will depend on the chain of events that would follow from the exact underlying cause gradually to immediate cause. After the words "due to (or as a consequence of)", which appear on the certificate, should be included not only as the direct cause or pathological process, but also indirect causes, for example where an antecedent condition has predisposed to the direct cause by damage to tissues or impairment of function, even after a long interval.

Therefore, the number may vary. **The cause mentioned in the last line of Part I will be the underlying cause of death and you will translate it into ICD-10**, in the exact way as shown in the ICD-10 coding prescribed pro forma. Part II is for any other significant condition that contributed to the fatal outcome, but was not related to the disease or condition directly causing death. Noting the approximate interval (minutes, hours, days, weeks, months or years) between the onset of each condition and the date of death helps the certifying doctor to establish the chain of events that led to the death, and is also useful subsequently in guiding the coder to choose the appropriate code. Below is an example of a death certificate with four steps in the chain of events leading directly to death.

International Form of Medical Certification of Cause of Death

	Cause of death	Approximate Interval between onset and death
I. Disease or condition directly leading to death*	(a) Pulmonary embolism (Due to or as a consequence of)	Minutes
Antecedent Causes Morbid conditions, , if any, giving rise to the above cause, stating the underlying Condition last	(b) Pathological fracture (Due to or as a consequence of)	2 days
	(c) Secondary carcinoma of femur (Due to or as a consequence of)	6 months
	(d) Carcinoma of breast (Due to or as a consequence of)	5 years
II. Other significant conditions contributing to the death, but not related to the disease or Conditions causing it	Diabetes mellitus- Non-Insulin dependent	10 years
*This does not mean the mode of dying, e.g. heart failure, respiratory failure. It means the disease, injury, or complication that caused death		

A short guideline from World Health Organization for writing cause of death on the Death Certificate in line with ICD-10 is provided below for better understandings:-

In line with ICD-10

-Quick reference guide-

Cause of death information serves

- epidemiology and prevention
- managing health care
- comparing health in different populations

Certification of death is one of the first steps in getting an overview of the health of people. The diseases or conditions recorded on a death certificate represent the best medical opinion. A properly completed cause of death certificate provides a description of the order, type and association of events that have resulted in the death.

The diagnoses reported on the certificate are coded with the International Classification of Diseases, 10th edition. This coded data is analyzed and used both nationally and internationally no matter what language was used to complete the certification.

Cause of Death on the certificate- how to fill in?

Death certificates may look different in most countries. But the section on the cause of death is identical world wide. That section has been designed by WHO, based on a century of experience. It has two parts, called Part I and Part II, and a section to record the time interval between the onset of each condition and the date of death.

Part I-is used for diseases or conditions that form part of the sequence of events leading directly to death.

The immediate (direct) cause of death is entered on the first line, **I(a)**.

There must always be an entry on line **I (a)**.

The entry on line Ia may be the only condition reported in Part I of the certificate.

Where there are **two or more conditions** that form part of the sequence of events leading directly to death. Each event in the sequence should be recorded on a separate line.

In any case you must record the disease, injury or external cause that resulted in the death. Do not record the **mode of dying**, such as cardiac arrest, respiratory failure or heart failure.

"Unknown" cause of death should be recorded in cases where thorough testing or autopsy examination cannot determine a cause of death. "Unknown" is better than any speculation on the possible cause of death.

Always fully spell out all terms. Abbreviations can be interpreted in different ways. Terms such as "suspected" or "possible" are ignored in evaluation of the entries. For example "suspected Diabetes" will be interpreted as "Diabetes". The four lines may not provide enough space for the chain of events. Do not waste space with unnecessary words. Some clinical terms are very vague. For example, "tumour" does not specify behaviour.

Duration-is the time interval between the onset of each condition that is entered on the certificate (not the time of diagnosis of the condition), and the date of death. The duration information is useful in coding certain diseases and also provides a useful check on the order of the reported sequence of conditions.

Part II-is used for conditions which have no direct connection with the events leading to death but whose presence contributed to death.

Cause of Death on the certificate- step by step

Start at line I(a), with the immediate (direct) cause, then go back in time to preceding conditions until you get to the one that started the sequence of events. You will get very close to the time the patient was healthy.

Now, you should have reported the underlying or originating cause on the lowest used line and a sequence of events leads from the underlying cause up to the immediate (direct) cause in the first line I(a).

Finally, record the time interval between the onset of each condition entered on the certificate and the date of death. Where the time or date of onset is not known you should record a best estimate. Enter the unit of time (minutes, hours, days, weeks, months, years).

Example

	Cause of death	Approximate Interval between onset and death
I. Disease or condition directly leading to death*	(a) Cerebral Haemorrhage (Due to or as a consequence of)	4 hours
Antecedent Causes Morbid conditions, , if any, giving rise to the above cause, stating the underlying Condition last	(b) Metastasis of the brain (Due to or as a consequence of)	4 months
	(c) Breast cancer (Due to or as a consequence of)	5 years
	(d)..... (Due to or as a consequence of)	
II. Other significant conditions contributing to the death, but not related to the disease or Conditions causing it	Arterial hypertension	3 years
	Diabetes melitus	10 years
*This does not mean the mode of dying, e.g. heart failure, respiratory failure. It means the disease, injury, or complication that caused death		

- **Write clearly** and do not use abbreviations.
- Be sure the information is **complete**.
- **Do not speculate** on the cause of death; rather record "cause unknown".
- Do not fill in laboratory results or statement like "found by wife".
- **One condition per line** should be sufficient.

International form of medical certification of causes of Perinatal deaths

In 1990, the World Health Assembly adopted a recommendation that countries should consider the inclusion on death certificates of questions about current pregnancy and pregnancy within one year preceding death. This information is sought, considering the vulnerability of women to death during pregnancy and delivery. The International form of Medical certification of cause of perinatal death differs from others. For perinatal deaths the death certificate does not ask for an underlying cause of death. Instead, it asks for the main cause in the fetus(still births) or infant(live birth), and the main cause in the mother. It asks for other causes and for other relevant circumstances.

A perinatal death can be either a live birth or a stillbirth according to the World Health Organization definition and formally covers the period from 28 completed weeks of gestation up to (but not including) 7 days after birth.

The perinatal death certificate recommended by the World Health Organization is shown in next page. The principles governing the concept of the perinatal period are that:

- a. the fetus is potentially viable
- b. both fetal and maternal causes need to be considered
- c. at a given period after gestation, the pattern of causes will be similar in both live births and stillbirths.

Writing Medical Certification of causes of Perinatal death

Whenever possible a separate certificate of cause of perinatal death should be completed, in which the causes are set out as follows:

- (a) main disease or condition in fetus or infant
- (b) other diseases or conditions in fetus or infant
- (c) main maternal disease or condition affecting fetus or infant
- (d) other maternal diseases or conditions affecting fetus or infant
- (e) other relevant circumstances.

The certificate should include identifying particulars with relevant dates and times, a statement as to whether the baby was born alive or dead, and details of the autopsy. For a thorough analysis of perinatal mortality, the following data on both mother and child are needed, in addition to information about the causes of death, not only in the case of perinatal death, but also for all live births.

Mother

- Date of birth
- Number of previous pregnancies: live births/stillbirths/abortions
- Date and outcome of last previous pregnancy: live birth/stillbirth/abortion

Present pregnancy:

- First day of last menstrual period (if unknown, then estimated duration of pregnancy in completed weeks)
- Antenatal care-two or more visits: yes/no/not known
- Delivery: normal spontaneous vertex/other (specify)

Child

Birth weight in grams

Sex: boy/girl/indeterminate

Single birth/first twin /second twin/other multiple birth

If stillborn, when death occurred: before labour/during labour/not known. Other variables that might appear on the basic certificate include particulars of the birth attendant, as follows:

physician/trained midwife/other trained person (specify)/other (specify).

The method by which the supplementary data are collected will vary according to the civil registration system obtaining in different countries. Where they can be collected at the registration of the stillbirth or early neonatal death, a form similar to the "Certificate of Cause of Perinatal Death" as shown below could be used. Otherwise, special arrangements would need to be made (for example, by linking birth and death records) to bring together the supplementary data and the cause of death. Where civil registration requirements make it difficult to introduce a common death certificate for liveborn and stillborn infants, the problem could be met by separate certificates for stillbirths and early neonatal deaths, each incorporating the recommended format for the causes of death.

Statement of causes of Perinatal death

The certificate has five sections for the entry of causes of perinatal deaths, labeled (a) to (e). In sections (a) and (b) should be entered diseases or conditions of the infant or fetus, the single most important in section (a) and the remainder, if any, in section (b). By "the single most important" is meant the pathological condition that, in the opinion of the certifier, made the greatest contribution to the death of the infant or fetus. Considering the multifactorial influence on perinatal death, this specific form is to be used which enables a detailed statistical analysis of such deaths.

Perinatal death Seal

The mode of death, e.g. heart failure, asphyxia or anoxia, should not be entered in section (a) unless it was the only fetal or infant condition known. This also holds true for prematurity. In sections (c) and (d) should be entered all diseases or conditions of the mother that, in the certifier's opinion, had some adverse effect on the infant or fetus. Again, the most important one of these should be entered in section (c) and the others, if any, in section (d). Section (e) is for the reporting of any other circumstances that have bearing on the death but cannot be described as a disease or condition of the infant or mother, e.g. delivery in the absence of an attendant. The following examples illustrate the statement of the causes of death for the cases described.

Example 1. A woman, whose previous pregnancies had ended in spontaneous abortions at 12 and 18 weeks, was admitted when 24 weeks pregnant, in premature labor. There was spontaneous delivery of a 700 g infant who died during the first day of life. The main findings at autopsy was "pulmonary immaturity". Causes of perinatal death:

- (a) pulmonary immaturity
- (b) -
- (c) Premature labor, cause unknown
- (d) Recurrent aborter
- (e) -

Example 2. A primigravida aged 26 years with a history of regular menstrual cycles received routine antenatal care starting at the 10th week of pregnancy. At 30-32 weeks, fetal growth retardation was noted clinically, and confirmed at 34 weeks. There was no evident cause apart from symptomless bacteriuria. A caesarean section was performed and a liveborn boy weighing 1600 g was delivered. The placenta weighed 300 g and was described as infarcted. Respiratory distress syndrome developed which was responding to treatment. The baby died suddenly on the third day. Autopsy revealed extensive pulmonary hyaline membrane and massive intraventricular hemorrhage.

Causes of perinatal death:

- (a) Intra ventricular hemorrhage
- (b) Respiratory distress syndrome
- Retarded fetal growth
- (a) Placental insufficiency
- (b) Bacteriuria in pregnancy
- (e) Caesarean section.

Example 3. A known diabetic, who was poorly controlled during her first pregnancy, developed megaloblastic anaemia at 32 weeks. Labour was induced at 38 weeks. There was spontaneous delivery of an infant weighing 3200 g. The baby developed hypoglycaemia and died on the second day. Autopsy showed truncus arteriosus.

Causes of perinatal death:

- (a) Truncus arteriosus
- (b) Hypoglycaemia
- (c) Diabetes
- (d) Megaloblastic anaemia
- (e) -

Example 4. A 30-year-old mother of a healthy four-year-old boy had a normal pregnancy apart from hydramnios. X-ray at 36 weeks suggested anencephaly. Labour was induced. A stillborn Anencephalic fetus weighing 1500 g was delivered.

Causes of perinatal death:

- (a) Anencephaly
- (b) -
- (c) Hydramnios
- (d) -
- (e) -

Recommendation

Essential use of ICD-10

1. All government and private health facilities and medical institutions in the country should essentially use ICD-10 in their records and reports and the same should be ensured by all concerned authorities through well designed guidelines, directives and continued monitoring.
2. All medical and health institutions, including hospitals of any size, in the country should equip themselves with WHO publication on ICD-10 (3 volumes; available on the Internet) as a reference and ICD-10 codes relevant to each medical specialty be prominently made available in concerned wards in the hospitals. No medical record should remain without ICD-10 code for the diagnosed disease.

Capacity Building for ICD-10 Use

3. Authorities should formulate a plan for regular orientation on the use of ICD-10 and every medical and health institution should make efforts to keep their medical/nursing/paramedical staff duly oriented on ICD-10 through well drawn and regularly conducted orientation programs in their institutions.
4. The third and fourth year medical and dental students should be given due orientation of writing ICD-10 codes during their learning of case history writing.
5. Directives need to be issued from heads of the medical/health institutions to all concerned Medical/Nursing/Paramedical personnel of all departments in the medical/health institutions for ensuring completion of medical records, and for clearly writing diagnosis using standard medical terminology, while avoiding the abbreviations.
6. Data on morbidity/mortality based on Medical Records should be regularly compiled, analyzed and should form the part of various documents/reports of the medical/health institutions including annual reports.
7. There should be regular visits / interactions to facilitate the speedy implementation of ICD-10.

Strengthening Medical Record Unit/Department and Computerized Medical Record System

8. The medical record system in each medical/health institution should be computerized with appropriately designed software for both outpatient and inpatient records, while using meticulously designed formats, local area network as well as internet facility in all the departments/wards of the medical/health institution.

9. The medical record department in each medical/health institution should be given highest priority and be headed by a senior level expert/officer of the same rank as in other existing technical departments in the same institution. A separate cadre for coder should be created for proper coding & recording purposes.
10. All the technical functionaries in the medical record department should be trained through the prescribed training programs and such training personnel should not be diverted to other departments. The contribution of medical record department functionaries in any of the research papers should be duly acknowledged.
