Introduction

Fisheries and aquaculture play an important role in the national economy of Bangladesh. Followed by the garments sector, fisheries sector is the second largest export industry from which Bangladesh earned USD 482 million in the fiscal year 2020-2021. The fisheries sector, including shrimp, accounts for about 3.57% of the national GDP, which is more than a quarter (26.50%) of the total income from the agricultural sector and 1.24% of the national export earnings. Despite the enormous potential of Bangladesh's shrimp sectors, it is confronted with a multifaceted problem. Smallholder farmers involved in shrimp farming are struggling to increase productivity while keeping up with changes in the aquaculture ecosystem that affect their livelihood opportunities. Access to finance, input and output market systems, poor infrastructure, institutionalization and capacity building, skills and knowledge development, adoption of adaptive technologies, including food safety, and transparency throughout the shrimp supply chain all contribute to the sector's sustainability. In this regard, the SCMFP project intervened to establish effective linkages between smallholders and relevant supply-chain actors in standardizing the extensive shrimp farming system through the implementation of a cluster approach. The shrimp supply chain must be standardized and simplified in order to implement sustainable farming and responsible sourcing. In response to the challenge, the DoF's SCMFP project has launched the pilot initiative and established 300 shrimp farming clusters with the goal of increasing farm productivity and ensuring transparency by integrating an e-traceability system with the farming clusters. Therefore, cluster profiling is an imperative step towards the sustainability of the shrimp business at local to international level.

Cluster profile plays the vital role in mainly attracting the investors and buyers. Because it contains the basic information, location of the cluster and size, current shrimp farming practices, farmed species, and shrimp yield, number of shrimp farmers and their male to female ratio and other relevant information. Cluster profile also act as the vital tool for decision making for the service providers, stakeholders, partners and financial institutions. To promote shrimp business across the international shrimp business arena, the cluster profile will serve as the powerful marketing tool. Besides, establishment and promotion of shrimp brand among the stakeholders is an inevitable step to sustain the shrimp business where cluster profile would serve the purpose.

Under the initiative of DoF's SCMFP project, each shrimp Cluster is formed containing on average 25 small holder shrimp farmers located in a specific geographic location at a possible close proximity, having interest to work together to increase improve their farm productivity, quality and quantity of produces without further damaging the environmental and ecological determinants to contribute to sustainable development agenda that leaves a better planet for the next generations. A total of 7498 small holder shrimp farmers are mobilized to form 300 shrimp cluster where male is 5820 and female 1678. Meanwhile, total area under the 300 shrimp clusters is about 2526.473 ha in the five districts namely Bagerhat, Gopalganj, Jessore, Khulna and Satkhira. Though, shrimp aquaculture practice in Bangladesh predominantly traditional, DoF's SCMF project is supporting the shrimp farmers to transform the traditional practice into improved traditional practice under the cluster approach. Under the cluster approach, the shrimp farmers can be grouped into three major groups based on their farmed aquatic species that vary spatially because of the water salinity, while the groups include Black Tiger, Giant freshwater prawn, Black Tiger and Giant freshwater prawn farmers. These types of information are essential elements to introduce the shrimp clusters as the successful entrepreneur and business promotion beyond the boundary of the country, that can be incorporated in a comprehensive profile. Therefore, the shrimp cluster profile is formulated to provide necessary information to the investors, buyers, policy makers and other stakeholders for strengthening decision making process towards sustainable shrimp farming practices in the coastal areas of Bangladesh.
